18th IAEE European Conference, Milan, Italy

Analysis of the potential to leverage price volatility through flexibility options in a local energy system

Chuen-Fung Tang, Marius Tillmanns, Frieder Borggrefe, Jan Priesmann, Aaron Praktiknjo Chair for Energy System Economics (FCN-ESE), E.ON Energy Research Center (E.ON ERC) RWTH Aachen University, Germany

Milan, 26th July, 2023

Effects of flexibilities in energy systems of a district is today's focus

Market design – System integration of flexibilities: Variable electricity tariffs, grid-oriented load control

What is the impact of time-variable electricity prices and shut-off periods for heat pumps on the behavior of actors

with regard to the energy system of a district?

2 18th IAEE European Conference Chur Milan, 26th July, 2023 chue

Chuen-Fung Tang et al. chuen-fung.tang@eonerc.rwth-aachen.de Analysis of the potential to leverage price volatility through flexibility options in a local energy system

District is viewed and optimized from two perspectives

Model 1: Consumer / provider model

Bi-level optimization:

- 1. Provider: Offering of energy prices
- 2. Consumer: Optimize costs of energy consumption
- 3. Provider: Optimize energy supply

Model 2: District model (Macro)

Optimization:

District: Optimization of the annualized costs of the

energy consumption for the district

Chuen-Fung Tang et al. chuen-fung.tang@eonerc.rwth-aachen.de Analysis of the potential to leverage price volatility through flexibility options in a local energy system

In the case of variable electricity prices, the price is divided into three daily periods

Model		Electricity supply		Constant electricity price [ct/kWh]	Variable electricity price [ct/kWh]			
Model 1: Cons	vider Consumer	Grid Provider	\rightarrow Provider \rightarrow Consumer	31.75 0 h 24 h	29 0 h	34	33 15 19	29 24 h
		Grid Provider	← Provider ← Consumer	6 0 h 24 h	5 0 h	7	6 15 19	5 24 h
Model 2: District model (Macro)		Grid	\rightarrow District	31.75 0 h 24 h	29 0 h	34	33 15 19	29 24 h
		Grid	← District	6 0 h 24 h	5 0 h	7	6 15 19	5 24 h

Analysis of the potential to leverage price volatility through flexibility options in a local energy system

During the shut-off periods, heat pumps must not be operated

5 18th IAEE European Conference Milan, 26th July, 2023

e Chuen-Fung Tang et al. chuen-fung.tang@eonerc.rwth-aachen.de Analysis of the potential to leverage price volatility through flexibility options in a local energy system

Introducing the measures leads to four cases

No HP shut-off

HP shut-off

6

Co	onstant electricity price		Time-variable ele	ectricity price		
	1		2			Less
Constant electricity price			Time variable electricity price			
	No HP shut-off		No HP sł	nut-off		
						Measu
	3		4			Jres
Co	onstant electricity price		Time variable el	ectricity price		
	With HP shut-off		With HP s	shut-off		More
Less		Measures			More	
18 th IAEE European Conference Milan, 26 th July, 2023	Chuen-Fung Tang et al. chuen-fung.tang@eonerc.rwth-aachen.de	Analysis of the potential to leverage price volatility through flexibility options in a local energy system	FCN I Future Energy Consumer Needs and Behavior	E.ON Energy Research Center	RWITHAA	CHEN RSITY

Consumer welfare increases while welfare on producer's side decreases

1. Constant electricity price / No HP shut-off

4. Time-variable electricity price / HP shut-off

ence Chuen-Fung Tang et al. chuen-fung.tang@eonerc.rwth-aachen.de Analysis of the potential to leverage price volatility through flexibility options in a local energy system

Measures lead to higher revenues, intensive battery use, larger heat pumps and storages

Higher revenues from electricity marketing (17 % Producer, 16 % Consumer)

4

More intensive use of the battery (33 % Producer, 18 % Consumer)

•

Larger heat pump (27 % Producer)

Installation of **PV panels** (*Producer*)

Larger thermal storage (86 % Producer)

Utilization of higher feed-in prices

Bridging the time of heat pump shut-off periods

Next steps 1 2 3

As a next step, we will investigate effects of further price signals and measures to control load

Variable electricity prices

Grid-oriented load control

What influence on the behavior of the actors with regard to the energy system of a district ...

...does **spot market-oriented electricity prices** have?

...does the load-oriented control of heat pumps have?

\mathbf{h}	
Ħ	Ħ
H	

... have procurement strategies of energy suppliers?

... does the load-oriented control of wall

boxes for battery electrical vehicles have?
